PROFESSIONAL SUMMARY

Data Analyst with 1 year of hands-on experience in e-commerce analytics and a B.Sc in Computer Engineering (April 2026). Built an end-to-end Python pipeline integrating 36 data sources (230K+ orders) with automated data-quality checks, and turned the data into churn, marketing and seller-performance insights for management. Skilled in SQL, Excel, Python (Pandas, SciPy) and Power BI (DAX), with a solid foundation in hypothesis testing and data modeling. Known for catching data errors before they reach decisions and turning analysis into clear, actionable recommendations.

PROFESSIONAL EXPERIENCE

Data Analyst, *SOFTCOUNT* 09/2025 – 09/2026 | New York City, USA (Remote)

Amazon E-commerce Analytics

- Data Engineering & EDA: Built an end-to-end Python pipeline (pandas, SciPy) integrating 36 raw sources (230K Amazon orders, 61K Keepa listings, ad data and 8.3K subscriber accounts) with automated data-quality checks; caught a field-definition error that inflated multi-unit revenue by up to 26x.
- Churn Root-Cause Analysis: Found that sellers who never listed a product cancelled at 85% vs 57% and drove 63% of all subscription cancellations, consistent across every sign-up year; the top stated reasons ("could not sell", "capital problem") covered 65%, pointing to onboarding, not logistics, as the main retention lever.
- Marketing Analytics: Audited four months of Meta and Google ad spend: showed both platforms cost the same per acquisition, and traced a 69% rise in CPA mainly to a 31% drop in purchases per click; recommended daily spend caps and funnel fixes before scaling budget.
- Top Seller Analysis: Analyzed 61K listings from 12 top sellers using Keepa data: best-ranked listings had 35x more reviews and 3x the FBA share (75% vs 24%), a pattern that held in 21 of 22 seller-categories.
- Statistical Analysis: Tested 10 business hypotheses with Welch t-test, Mann-Whitney U, chi-square and effect sizes; showed Mexico delivered 49% of profit from 39% of orders, and proposed A/B tests to confirm causal levers.
- Data Modeling & Reporting: Delivered a data dictionary, BI-ready datasets for Tableau/Power BI, a star-schema data model and ETL proposal, and 13 prioritized data requests to management.

EDUCATION

Vistula University, *B.Sc. in Computer Engineering* 10/2022 – 04/2026 | Warsaw, Poland

HTW Dresden, *Erasmus Exchange* 09/2024 – 02/2025 | Dresden, Germany

TECHNICAL SKILLS

Excel — PivotTables, XLOOKUP, SUMIFS/COUNTIFS, Conditional Formatting
SQL — PostgreSQL, SQL Server (CTEs, JOINs, Window Functions, Aggregations)
Python — Pandas, NumPy, SciPy, Plotly, Scikit-learn, Jupyter Notebook
BI & Reporting — Power BI (DAX, Power Query),Power Automate, KPI Dashboards, Automated Reporting
Data Quality & Modeling — Data Validation, Data Profiling, Data Cleaning, Star Schema, Data Dictionary, ETL Design
Statistics — Descriptive Statistics, Hypothesis Testing (basics), A/B Testing concepts
Tools & Platforms — Git, GitHub

PROJECTS

IT Support Ticket Analysis & Automated Weekly Reporting , *PostgreSQL | Power Query | Power BI (DAX) | Power Automate*

- Built an end-to-end data pipeline for 5,000 IT support tickets: PostgreSQL → Power Query → Power BI star schema → automated KPI email via Power Automate.
- Surfaced 82.1% SLA compliance and 16.9h avg resolution time through DAX KPI measures (SLA Met %, Avg Resolution Hours, Open Tickets, Avg CSAT), with automated weekly KPI summary landing every Monday 09:00 Europe/Warsaw — replacing manual reporting effort.

Olist E-Commerce Executive Dashboard , *PostgreSQL | SQL | Power BI | DAX |*

- Built a 2-page executive Power BI dashboard on 99K orders and BRL 15.4M revenue, answering 6 business questions on revenue concentration, delivery SLA, and category dependency for stakeholder review.
- Flagged single-market dependency (São Paulo = 37% of revenue, top 3 states = 63%) using DAX SWITCH and disconnected tables, driving market-expansion recommendations for decision-makers.

Remote Work Burnout Risk Segmentation for HR , *Python | Pandas | Plotly | EDA*

- Performed EDA on 3,157 survey responses across 6 regions (Remote vs Hybrid vs Onsite) using Python, Pandas, and Plotly; cleaned, validated, and merged multi-region CSV sources into a single analysis-ready dataset to ensure data quality.
- Engineered a composite burnout risk score for employee segmentation and surfaced wellbeing trends through interactive Plotly dashboards for HR review and follow-up action.
